

MARIUS BRIDGE

The second of this 3 part seminar series will focus on the Marius Bridge restoration. This seminar will be **offered on 5 separate dates** to accommodate schedule conflicts. The 3rd part of this series will be given through the Spring of 2010.

The Marius Bridge is a fixed appliance with a unique, high precision mechanism that allows patients to remove it themselves for easier access for cleaning or for repairs and/or modifications.

It is an approach that makes it possible to treat the fully edentulous patient who may have poor lip support, and severe bone loss resulting from the extraction of teeth in previous years.

This course is part of a continuum on the orthopedic approach to fixed restorative care. It will be a comprehensive discussion of all aspects of patient care; from diagnosis and surgical therapy, to step by step details of the restorative and laboratory phase of treatment.
