

PROFILE PROSTHESIS

The first of this 3 part seminar series will focus on the Profile Prosthesis restoration. This seminar will be **offered on 5 separate dates** to accommodate schedule conflicts. The 2nd and 3rd parts of this series will be given through the Fall and Spring of 2009/2010.

The Profile Prosthesis is a fixed detachable bridge which uses a framework design with subgingival abutment emergence .

It is an approach that makes it possible to treat the fully edentulous patient who may have insufficient lip support, and severe bone loss resulting from the extraction of teeth in previous years. The Profile Prosthesis is indicated for most patients who wear or who will have to wear complete dentures.

This will be a comprehensive discussion of all aspects of patient care; from diagnosis and surgical therapy, to step by step details of the restorative and laboratory phase of treatment.
